

Appendix D1. Roadway Project List – CAMPO and DCHC MPOs

Each row in the table is a separate highway project. The attribute information for each project is presented by columns, and includes the following:

- Project ID – This number facilitates the identification of projects in the long-range plan.
- Road Name – The project name is the name of the road.
- From/To – This usually identifies the name of the two road intersections between which the project is to be constructed.
- MPO – Distinguishes between projects that are in CAMPO and DCHC MPO; the project rows are color-coded by MPO as well, with DCHC MPO projects listed first, followed by CAMPO projects.
- Existing # of Lanes – This identifies the number of current lanes. “o” indicates a new road alignment – in other words, there is no existing road.
- Proposed # of Lanes – This identifies the number of lanes proposed in the plan; if the number of lanes does not change from the existing #, the project is not a widening project but instead will make safety or intersection improvements or other non-capacity-adding changes.
- Distance – The mileage of the project between the project limits.
- TIP# -- The project reference number for those projects which are contained in the 2009-15 Transportation Improvement Program.
- Regionally Significant? – Regionally Significant projects provide access to and from the region, or to major destinations in the region. They are usually classified by the FHWA as interstate, freeway/expressway, urban principal arterial, rural interstate, or rural principal arterials. Note that the FHWA functional classifications serve a different purpose than the local functional classification used by the MPO, and as a result, the two classification systems are significantly different. Generally, the regionally significant designation includes interstate highways, U.S. highways, freeways, and North Carolina signed roads that are the primary road in a corridor. Rail transit facilities, which are described in a separate section, are considered regionally significant. The Regionally Significant designation is important – if a Regionally Significant project is changed (e.g., completion year, travel capacity) after the Air Quality Conformity Determination for the 2035 LRTP has been approved, then the Conformity Determination process might have to be redone.
- Exempt from AQ – Some transportation projects are exempt from air quality conformity determination according to Title 40, Code of Federal Regulations (CFR), PART 93.126 and PART 93.127. The most important implication of this exemption is that the projects may proceed toward implementation in the absence of an approved and conforming Long Range Transportation Plan. These exempt projects tend to be transit services, and highway projects that do not add roadway capacity but reduce travel delays, thereby reducing vehicle emissions.
- Project Capital Cost – The total costs includes those estimated costs to be incurred between January 1, 2009 and December 31, 2035. Cost information from the current Transportation Improvement Program (TIP) and any related studies (e.g., I-40 HOV) was used to calculate costs for projects, when available, and a modified version of the current highway cost template from the NCDOT (North Carolina Department of Transportation) was used for the majority of projects. Projects with a “2040” AQ Year are post year projects that are not included in the 2035 LRTP and therefore the project cost is not in the Plan, as well.
- AQ Analysis Year – There are three AQ periods analyzed, 2009 to 2015, 2016 to 2025, and 2026 to 2035. The AQ Year indicates in which analysis period the particular project will be completed and in service.
